

Lab 8: SnapMirror from vfiler network and vfiler0 loopback

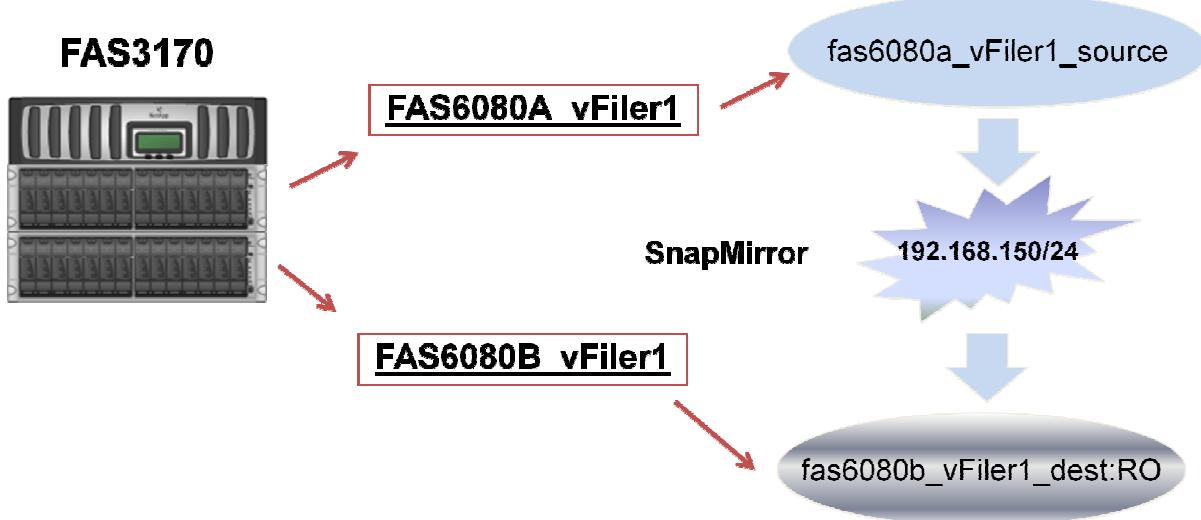

Two methods of mirroring, from the vfiler and from the physical filer, vfiler0. The advantage of from a vfiler is if the vfiler moves, then the mirror follows. If from vfiler0, mirrors need to have a resync on a new target controller (not initialize so easy enough to do). The advantage from vfiler0 is if there is a DMZ or no network between vfilers, you can still replicate between vfilers. We can also use FlexClone to do this.

Confirm you can ping both vfilers

```
fas3170> ping 192.168.150.103
```

```
fas3170> ping 192.168.150.104
```

1. SnapMirror vFiler to vFiler (6080a to 6080b) using the vFiler network

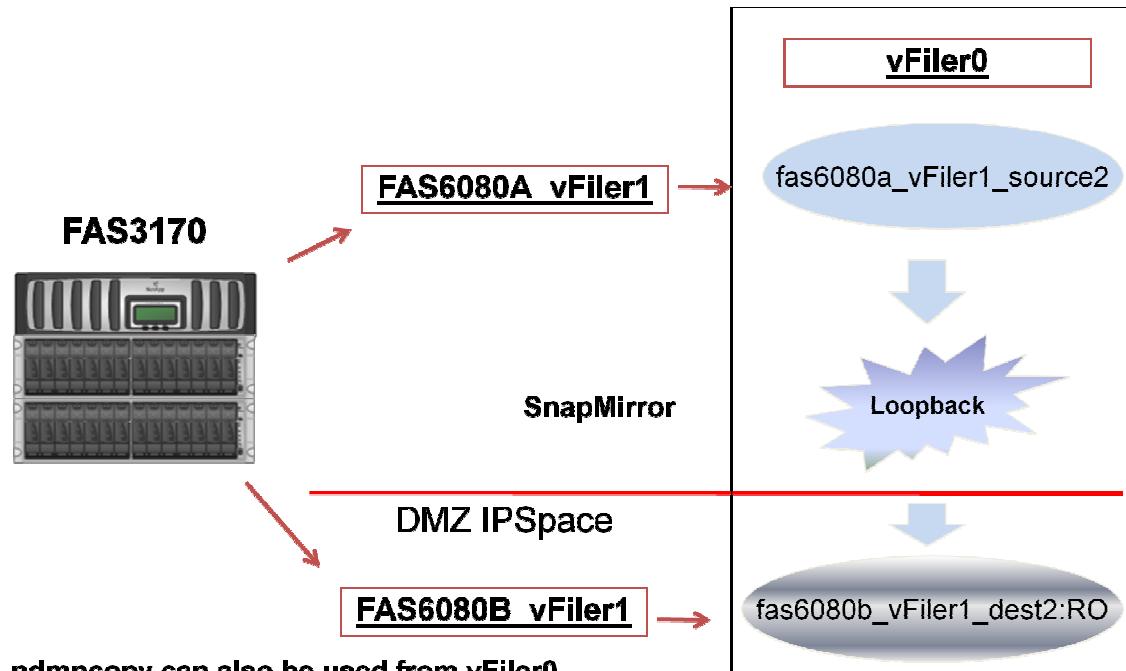

Note: `ndmpcopy` can also be used vFiler to vFiler

Procedure – snapmirror initializes from the vfiler – run all commands on the FAS3170 vfiler0. You can copy/paste into a source script file (wrfile /etc/source , put in commands, then “source -v /etc/source”)

- fas3170> `vol create fas6080a_vfiler1_source -s none aggr0 20m`
- fas3170> `vfiler add fas6080a_vfiler1 /vol/fas6080a_vfiler1_source`
- fas3170> `vol create fas6080b_vfiler1_dest -s none aggr0 20m`
- fas3170> `vfiler add fas6080b_vfiler1 /vol/fas6080b_vfiler1_dest`
- fas3170> `vfiler run * snapmirror on`
- fas3170> `vfiler run * options snapmirror.access host=192.168.150.100,192.168.150.101,192.168.150.103,192.168.150.104`
- fas3170> `vfiler run fas6080b_vfiler1 vol restrict fas6080b_vfiler1_dest`

- **fas3170> vfiler run fas6080b_vfiler1 snapmirror initialize -S
192.168.150.103:fas6080a_vfiler1_source fas6080b_vfiler1_dest**
- **fas3170> vfiler run fas6080b_vfiler1 snapmirror status**

2. SnapMirror via base VFILER0 (loopback) (vFiler networks NOT used) – no net available between vFilars. (A way to get data shared async to a DMZ)

Note: `ndmpcopy` can also be used from vFiler0

Procedure – snapmirror initializes from vfiler0 (loopback) – run all commands on the FAS3170 vfiler0.

You can copy/paste into a source script file (`wrfile /etc/source`, put in commands, then “`source -v /etc/source`”)

- `fas3170> vol create fas6080a_vfiler1_source2 -s none aggr0 20m`
- `fas3170> vfiler add fas6080a_vfiler1 /vol/fas6080a_vfiler1_source2`
- `fas3170> vol create fas6080b_vfiler1_dest2 -s none aggr0 20m`
- `fas3170> vfiler add fas6080b_vfiler1 /vol/fas6080b_vfiler1_dest2`
- `fas3170> vol restrict fas6080b_vfiler1_dest2`
- `fas3170> snapmirror initialize -S fas6080a_vfiler1_source2 fas6080b_vfiler1_dest2`
- `fas3170> snapmirror status`
